TITLE OF WORK ORDER JOHN SEVIER FOSSIL PLANT - CONSTRUCT FLY ASH POND ORDER NO. 510633-20656

IN AREA J

AUTH. NO. \_\_\_\_\_

LOCATION SYMBOL SE-27

GIVE DETAILS OF CHANGES IN THE COMPLETED WORK FROM THAT AUTHORIZED BY THE WORK ORDER OR JOB ORDER. LIST ANY AUTHORIZED WORK LEFT UNFINISHED. INDICATE THE ORGANIZATION RESPONSIBLE FOR FINAL COMPLETION OF SUCH UNFINISHED WORK. AND GIVE REFERENCE TO JOB ORDER OR FORM 1663 AUTHORIZING SAME.

Complete. This superseding completion notice is submitted to provide an overrun explanation for the work order.

The following conditions contributed to the overrun on the construction of Ash Pond "J".

1. Underestimated the amount of dirt needed to build dikes and the shortage of suitable dirt in the excavation.
2. Ran into layer of shale in the bottom of excavation which had to be sealed with clay.
3. A portion of the river bank slid into the river making it necessary to rip-rap the river bank for several hundred feet.
4. Leaks developed in the discharge culverts which had to be partially uncovered and the joints sealed.
5. A change in design criterion which made it necessary to change the dike configuration along Dodson Creek.

ENGINEERING ESTIMATE OF FACILITY COST

Date December 14, 1984

PROJECT: John Sevier Steam Plant

FEATURE: New Fly-Ash Disposal Area J

PURPOSE AND SCOPE: Estimate the total project cost to move the centerline of the dike along Dodson Creek on the north end of ash pond J and to complete the riverbank dike adjacent to the spillway outfall. This revision is based on actual costs through October 1984 with remaining field construction based on OC estimate number CSB 85-030.

ESTIMATE REQUESTED BY O. P. Thornton DATE October 31, 1984

REFERENCE MEMO (IF ANY) O. P. Thornton to W. D. Hall, 11/27/84 (FEP 841127 004)

Cost Estimate Request (if any) FEPJSF84-1002 (FEP 841031 004)

CLASSIFICATION OF ESTIMATE

- 1. Order of Magnitude--Variable accuracy usually based on previous similar cost information.
- 2. Preliminary Estimate--Accuracy insufficient for budgeting, but a guide to further interest.
- 3. Budget or Authorization Estimate--Suitable for budgeting.
- 4. Detailed Estimate--Prepared from complete engineering specifications, drawings, and site surveys.
- 5. Contract Bid Estimate - For purchase requisition or bid award evaluation.
- 6. Other -

ESTIMATED COST: \$ 3,613,700

COMMENTS: Total Engineering and Construction estimate based on Engineering starting in October 1981 and completed in April 1985, and based on Construction starting in January 1982 and completed in April 1985. Excludes other Power organizations and other TVA organization expenses and overheads.

JOHN SEVIER STEAM PLANT - ASH POND J - SOILS INVESTIGATION ON ASH  
MATERIAL - EN DES SOILS SCHEDULE 6.3

Testing of bag samples taken from the ash disposal areas as directed by Fossil Engineering Project (FEP) personnel has been completed. In addition to the requirements outlined in your memorandum of October 30, 1984, to W. H. Childres, saturated R and direct shear tests were performed as requested by the Geology and Geotechnical Engineering Group (GGEG) staff.

Index tests (ASTM D 4318), particle-size analyses (ASTM D 422), standard compaction tests (ASTM D 638), and saturated triaxial R tests with pore pressure measurements were performed on bag samples of three different types of ash. Only two of the three samples were chosen for direct shear tests by the GGEG staff. Specimens for triaxial R and direct shear tests were remolded at 95 percent maximum dry density and at 3 percent below optimum water content. Test results are shown in the attachments. The apparent triaxial shear strength parameters varied from  $c = 0$  tsf and  $\phi = 11.4^\circ$  to  $c = 0.08$  tsf and  $\phi = 20.5^\circ$ . The effective shear strength parameters ranged from  $c = 0.03$  tsf and  $\phi = 17.3^\circ$  to  $c = 0.28$  tsf and  $\phi = 28.6^\circ$ . The direct shear strength parameters are very similar on the two types of ash tested, being  $c = 0.13$  tsf and  $\phi = 31.2^\circ$  for pond J ash and  $c = 0.07$  tsf and  $\phi = 31.9^\circ$  for ash from the southeast bank.

It should be noted that during triaxial shearing on the remolded ash specimens from pond J and the southeast bank, the deviator stress reached its peak very early and then dropped constantly as the developed pore pressure increased continuously to a value equal to the applied confining pressure. It was apparent that an initial liquefaction occurred and the ash exhibited no resistance to deformation at the final stages of static loading. In view of these critical phenomena developed on the ashes of pond J and the southeast bank, the shear strength parameters based on the

Avg. Area = 835<sup>sq</sup>'

Riprap Required = 650' x 835<sup>sq</sup>' = 542,750 CU. FT = 20,100 C.Y.

20,100 C.Y. x 1.8 TONS/C.Y. = 36,185 TONS

Say 36,200 TONS

For Dike Relocation along Dodson Creek:

Begin Relocation @ Sta. 36+70±

End Relocation @ Sta. 43+50± BK. = Sta. 44+65± AH.

43+50	44+65
- 36+70	- 36+70
680'	795'

Unclassified Excavation (Item 120)

700' x 660<sup>sq</sup>' = 462,000 CU. FT. = 17,100 C.Y.

Say 17,000 C.Y.

Earth Fill

600' x 720<sup>sq</sup>' = 432,000 CU. FT. = 16,000 C.Y.

Say 16,000 C.Y.

~~Dumped Bottom Ash Fill~~

~~600' x 1350<sup>sq</sup>' = 810,000 CU. FT. = 30,000 C.Y.~~

~~Say 30,000 C.Y.~~

Superseded: See caks.  
 dated 10/29/84 for  
 compacted ash fill.  
 P.D.P.

Crushed Stone Surfacing (Item 305)

16' x 680' x 1/3' x 125<sup>lb</sup>/CU. FT. / 2000<sup>lb</sup>/TON = 226.7 TONS

Say 225 TONS (FOR RELOC. SECTION OF DIKE)

Seeding & Mulching (Items 580 & 582)

(120' x 800') + (35' x 680') = 96,000 S.F. + 23,800 S.F. = 119,800 S.F. / 9<sup>SF</sup>/3Y  
 = 13,310 S.Y.

Say 13,500 S.Y.

DATE : November 16, 1984

841116T0293 (2)

SUBJECT: JOHN SEVIER STEAM PLANT - ASH POND "J"-SLOPE STABILIZATION MODIFICATIONS

R. G. Domer's September 12 memo to you (FEP 840912 002) outlines additional work to the ash pond dikes for slope stability improvements. These costs are to be charged to the original work order. A copy of Mr. Domer's memo is attached for your ready reference. Due to schedule delays, scope changes, and inclement weather the original work order is already significantly "overrun" and we thought it might be well to bring everyone up to date on this activity. Outlined in the following paragraphs is a brief chronology of this project.

Cost estimate number 82-19 R1, dated March 2, 1982, authorized \$1,369,000 to construct ash pond J during calendar year 1982. The original scope indicated that the 486,000 cubic yards of fill material required for the dike would be available from a borrow area inside the dike and another borrow area outside the dike and across the Southern Railway railroad. Each area was to contain approximately 50 percent of the required material. Both of these areas required permits from agencies outside TVA in order to obtain the necessary material. The area inside the pond required a 404 permit before excavation could continue below elevation 1075. The area outside the dike required a permit from Southern Railway for a temporary crossing of the railroad.

Construction actually started on June 21, 1982, within a few days after project authorization. The 404 permit was received from the Corps of Engineers on October 7, 1982, and by November 25, 1982, all material inside the pond had been expended. A total of 200,000 cubic yards of fill had been placed for the dike. Production was slowed during this period due to delays in obtaining the 404 permit and 23 days of inclement weather.

All work was suspended on November 25, 1982, pending approval of the permit to cross the railroad. After the permit was secured, work was resumed on December 7, 1982. Earthwork was completed on September 30, 1983, with 516,267 cubic yards being placed. During this period, fill placement was suspended 70 days due to inclement weather.

Since only 200,000 cubic yards of fill were available inside the dike, approximately 316,267 cubic yards were hauled from the area across the railroad. This resulted in additional haul time and an expansion of this borrow area beyond the original limits. Additional material was also required for a cutoff trench to correct seepage underneath the dike. Following is a tabulation of the additional material handled:

Buy U.S. Savings Bonds Regularly on the Payroll Savings Plan

JOHN SEVIER STEAM PLANT - ASH POND "J"-SLOPE STABILIZATION MODIFICATIONS

	<u>Original Estimate</u>	<u>Actual (CY)</u>	<u>Additional Material</u>
Dike fill	486,000	516,267	30,267
*Topsoil Stripped and Stockpiled	16,133	63,000	46,867
Topsoil Removal	6,133	63,000	46,867
Fill for Seepage	0	50,000	<u>50,000</u>
Total			174,001 CY

\*Double handling due to delay in railroad crossing permit.

Construction on work items not in the original scope was started in September 1983 and completed in January 1984. These items include: Polly's Branch relocation, a turnaround at the outfall pipes, a walkway to the out-fall pipe, and a floating skimmer. Mobilization was begun on March 27 for emergency repairs to ash pond J. This emergency work consisted of construction of an anti-seepage collar around one of the spillway discharge pipes, grouting of leaking joints in one discharge pipe, and replacement of riprap at the outfall of the discharge pipes. All of this work was completed on May 30, 1984.

Attached for your information is a summary of actual costs to date and the estimated additional costs for the stabilization work.

JOHN SEVIER FOSSIL PLANT - ASH DISPOSAL PROGRAM

- References:
1. My memorandum to C. C. Schonhoff dated June 3, 1984 with attachment on the above subject (M53 840530 912)
  2. Letter from Leo H. Gerbus to the Land Branch dated August 23, 1984 regarding the sale of land near John Sevier (M47 840828 403)

A meeting was held at John Sevier on August 14, 1984 to discuss plans for ash disposal addressing immediate and long-range needs. Those in attendance at the meeting represented the Divisions of Engineering Design (EN DES) and Fossil and Hydro Power (F&H PR).

To begin the meeting, representatives of EN DES presented total costs for additional repairs necessary to give the pond J dikes an acceptable factor of safety. To date, \$105,000 has been spent on repairs. In order to meet acceptable safety standards, an additional \$674,000 will have to be spent on repairs to pond J (\$509,000 for riprap of riverbank and \$165,000 for constructing a 4:1 slope on the dike at Dodson Creek). After considerable discussion of these repair figures, F&H PR agreed that this work is necessary; and that these repairs to pond J should be charged to the original work order.

At this point in the meeting, attention was directed toward immediate plans to support ash disposal needs. Presently, we have a usable ash capacity of 665,000 tons (400,000 tons in pond 2 and 265,000 tons in pond J). The final usable volume for pond J is 500,000 tons, which is 300,000 tons less than the original design volume. This reduced volume is negatively impacting the life of our overall ash disposal plan and forcing the necessity for a dry ash-handling system one year earlier than stated in the above-referenced memorandum. Between now and March 1986, we must dispose of 547,000 tons of ash. Since ash to be produced approximately equals the remaining storage capacity, it is essential that additional disposal capacity be provided by March 1986. The need for this early date has been a direct result of problems with pond J.

Paul Wade

JOHN SEVIER FOSSIL PLANT - ASH DISPOSAL PROGRAM

To meet our ash disposal requirements until the dry ash collection system is in operation, we recommend the following three actions be taken: (These actions are required to provide a water inventory in pond 2 to support the continued disposal of bottom ash and other plant wastewater streams.)

1. Reclaim and stack 400,000 tons of ash from the bathtub. This action is being implemented by the plant as equipment becomes available. However, bids will be solicited and will be awarded if proven to be economical. The estimated cost for this work is \$1,400,000.
2. Pond 2 will be full by spring 1986. Dredge 400,000 tons from pond 2 to the bathtub beginning in March 1986. The estimated cost for this is \$400,000.
3. Presently, a contract is in progress for removing 120,000 tons of dry bottom ash from pond 2 and reclaiming a portion of the earth borrow pit across the railroad tracks from pond 2. As soon as this contract is completed (late November 1984), set up a reclaim pond in pond 2 using tractor-scrappers (two CAT 637D's and one dozer, plus operators for two or three days per week). Dry stacking of this material will be at the abandoned section of Polly's Branch and on the abandoned ash ponds.

The conversion to dry fly ash handling is felt to be the most practical alternative to meet long-range ash disposal needs. However, the recent offer by Mr. Gerbus (reference 2) to sell land to TVA must be evaluated along with dry ash handling prior to making a final decision. Possibly, this land can be purchased and developed to support dry ash stacking for plant life. Independent of land considerations, the conversion to dry fly ash handling is expected to cost between \$8,000,000 and \$10,000,000.

In order to meet the additional ash-handling requirements mentioned in item 3 above, the plant will need two CAT 637D tractor-scrappers. These can be purchased with the money allocated for a dragline for fiscal year 1985, since a dragline will not be necessary for this operation. The cost of the two tractor-scrappers should be approximately \$565,000; \$555,000 is budgeted.

3

Paul Wade

JOHN SEVIER FOSSIL PLANT - ASH DISPOSAL PROGRAM

In view of the above, we will proceed immediately with a request for EN DES to prepare a cost estimate for dry fly ash handling. Also, we will prepare necessary work orders and project justification to begin construction in fiscal year 1985.

## Memorandum

M. H. Miller  
333 SPT-K  
TENNESSEE VALLEY AUTHORITY

FEP '840912 002

TO : C. C. Schonhoff, Director of Fossil and Hydro Power, 716 EB-C  
FROM : R. G. Domer, Director of Engineering Projects, W11A6 C-K  
DATE : SEP 12 1984  
SUBJECT: JOHN SEVIER STEAM PLANT - ASH POND J - SLOPE STABILIZATION MODIFICATIONS

Representatives from our respective staffs met with plant personnel in B. B. Street's office on August 14, 1984, to discuss the results of our recent slope stability analyses on the dikes for the subject project. The following areas were of primary concern:

- Area 1. The 600+ -foot-long section of riverbank dike adjacent to the spillway outfall.
- Area 2. The 1000+ -foot-long section of riverbank dike between the abandoned bridge and the fisherman's access ramp.
- Area 3. The 450+ -foot-long section of dike along Dodson Creek on the north end of ash pond J.

Our analyses indicate only area 2 is sufficiently stable to resist landslides without additional modifications. The safety factor against sliding is less than 1.0 for areas 1 and 3, and they will require additional modifications to obtain an acceptable safety factor for long-term operational reliability. Although these dike areas were originally designed to provide a 1.5 safety factor, our reanalysis has discovered the following discrepancies:

1. The original dike design assumed a wide berm between the toe of the new ash pond dike and the existing riverbank. The dike was actually located (per design drawings) too close to the river. The riverbank actually undercuts the dike foundation zone.
2. Original slope stability analyses were performed only for normal operating and construction conditions while our recent analysis for the long-term steady seepage yields lower, unacceptable, safety factors.
3. Our original design also called for granular material to be placed in the outside regions of the dike, but construction drawings made placement of granular material optional; therefore, sufficient granular material was not placed, thus reducing the calculated factor of safety.

In addition to our analysis we investigated various solutions to improve the safety factors for areas 1 and 3, but recommended that a safety factor of 1.5 is most desirable. To obtain this degree of safety would require placing an additional 39,000 tons of riprap at area 1 and moving the centerline of the dike toward the inside of the new pond, thereby creating a new outer dike slope of 4:1 for area 3. The construction costs for this effort would be on the order of magnitude of \$680,000.

2

C. C. Schonhoff

SEP 12 1984

JOHN SEVIER STEAM PLANT - ASH POND J - SLOPE STABILIZATION MODIFICATIONS

Less costly modifications could be done but would not provide the recommended 1.5 safety factor. Construction in area 3 would also be delayed since placement of additional riprap on the outside slope of the dike would require an environmental review and approval process.

Therefore, we are proceeding with design and construction and will charge all costs to the original work order in accordance with the concurrence of your representatives at the August 14, 1983 plant meeting. Construction will begin by October 1, 1984, and be completed by December 31, 1984, with priority placed on completing the earthfill for area 3.

Since implementation of these modifications will decrease the ash disposal area of pond J, the long-term ash disposal plans (conversion to dry stacking) will need to be reevaluated and in all probability accelerated by approximately one year. The Office of Engineering will prepare a cost estimate for providing the dry ash handling facilities upon receipt of your scope of work document, but will also require separate funding for this engineering effort since it is not associated with the original work order for ash pond J. We can provide you with an estimate of our anticipated engineering costs for this cost estimate after receipt of your scope-of-work document.

John Sevier S.P. - Ash Pond V  
Dike Slope Stabilization

COMPUTED RDP DATE 7/84

CHECKED DATE

On 7/16/84, R.A. Powell of OE-FEP and Brian Frederick of USB inspected the exterior dike slope and south bank of Cherokee Reservoir east of the abutment of the dismantled bridge. During subsequent discussions with S.B. Ahmed and S.A. Stone of OE-CEB it was determined that riprap stabilization of this area was not required. This is due primarily to the high elevation of bedrock in this area as evidenced by field observations and from the soils investigation borings performed by SME (EN DES SOILS SCHEDULE NO. 6.2). Also, strength parameters of the foundation soils were greater.

R.A. Powell

TENNESSEE VALLEY AUTHORITY

FDP '84 0329 003

TO : H. S. Fox, Director of Fossil and Hydro Power, 716 EB-C

FROM : R. W. Cantrell, Manager of Engineering Design (Acting), W11A9 C-K

DATE : MAR 29 1984

SUBJECT: JOHN SEVIER STEAM PLANT - ASH POND J REPAIRS

This is to confirm the agreement made by our respective staff representatives during the March 16, 1984, meeting at John Sevier Steam Plant regarding the subject repairs.

EN DES and CSB will proceed immediately with design and construction to repair the actual and potential riverbank slide areas which were identified during the March 8, 1984, inspection of the subject plant's ash disposal areas.

The scope of work for these repairs is as follows:

1. Stabilize approximately 600 feet of riverbank in the vicinity of the existing pond discharge pipes.
2. Construct a permanent access road at the base of the dike around the western end of pond J (approximately 1500 feet).
3. Regrade the roadway surface on top of the dike to slope toward the pond in accordance with original design drawings.
4. Repair the washout of the interior slope of the dike at the eastern end of the pond.
5. Seal off leakage around the existing pond discharge pipes.

Note: These work areas are identified on the attached marked-up print of drawing 10W286-1 R2.

EN DES and CSB's order-of-magnitude costs for completing these repairs are \$22,000 and \$350,000 respectively. Due to the urgency for completing this work, we will charge all costs to work order number 51063-20656, account number 544-30-20656 per your staff's verbal request at the March 16, 1984, meeting. CSB mobilized their forces on March 26, 1984, and anticipates completing these repairs in September 1984. We expect pond J could be returned to service by late April 1984. Modifications to the existing 404

2

H. S. Fox  
MAR 29 1984

JOHN SEVIER STEAM PLANT - ASH POND J REPAIRS

permit will be performed concurrently with the physical construction repairs per our verbal coordination with the Corps of Engineers and is included in our estimated costs.

EN DES is initiating an authorization level cost estimate for the purpose of revising the work order (account 544-30-20656) and authorizing the additional funds necessary for EN DES and CSB to perform this work which is outside the scope of the original work order.

Memorandum

TENNESSEE VALLEY AUTHORITY

FDP '84 0328 007

TO : Fossil Design Projects Files

FROM : Marvin H. Miller, Senior Civil Engineer, 333 SPT-K

DATE : MAR 28 1984

SUBJECT: JOHN SEVIER STEAM PLANT - ASH POND J - REPORT OF RIVERBANK SLIDE AND PROPOSED REPAIRS

On March 8, 1984, while participating in the spring inspection of John Sevier's ash disposal areas, Ronnie Powell (FDP) and Robert Spencer (CEB) discovered a slide at the riverbank at the base of Pond J's dike. The 65-foot long slide extended from the toe of the dike into the Holston River. This slide had eroded the foundation support for the dike creating a serious hazard to the dike itself. See Attachments A and B. FDP immediately notified F&H PR of the slide and the need for repairing it before the river level rises significantly. F&H PR requested EN DES to provide recommendations for the repair work to be done.

John Hillier Stivers, Syed Ahmed, and I visited the site on March 12, 1984. After the inspection of Pond J, we recommended additional work along the riverbank adjacent to the slide. This additional 600 ± feet of nearly vertical riverbank could slip at any time. Because the toe of the dike is so close to this bank, the dike is also susceptible to failure. FDP informed F&H PR the cost to repair the slide and stabilize the riverbank could be several hundred thousand dollars. F&H PR requested all cost be charged to the work order for Pond J. FDP requested CSB to mobilize for the slide repair.

On March 14th, Ronnie Powell returned to the site with CSB estimator Jimmy Jenkins and CSB's Bobby Elliott. While they were inspecting the work site, F&H PR personnel removed a spillway wier in preparation for raising the pond level. The resulting surge of water thru the discharge pipe washed away the riprap at the outfall, exposing the vertical riverbank at the toe of the dike. The plant immediately took Pond J out of operation. This new failure occurred within the 600 ± additional feet of riverbank EN DES recognized as a potential slide area.

On March 16th, O. P. Thornton, R. E. Harris, and John Hillier Stivers and CSB's Jim Sullivan, Bob Bruer, Bobby Elliott, and Jimmy Jenkins met Jack Thompson of F&H PR at Buford Street's office at the plant site. EN DES presented details for the proposed repairs. All parties agreed the entire 600 ± feet of riverbank should be stabilized immediately. A permanent access road will be constructed at the base of the dike around the western end of Pond J. The roadway surface on top of the dike will be graded to slope to the inside in accordance with the original design drawings. A washout of the interior slope of the dike at the eastern end of the pond will also be repaired. Leakage around the pond discharge pipes will be stopped.

CSB will perform all construction. EN DES will provide design drawings for the dike stabilization.

RE: John Sevier S.P. - Ash Pond J dike - slope failure

Attached is a tabulation of recommended properties for compacted earthfill in situ soil, and uncompacted rockfill material for use in the stability analysis of the dike from STA. 44± to STA. 50+ <sup>For</sup> loading conditions and safety factors, pl. refer Civil Design Guide DG-<sup>C1-4.2</sup> Section 5.4.5.

If you have any question, pl. contact Syed Ahmed (ex: 6905).

# JSE ASH POND J REPAIRS — 1984

COSTS

COMPUTED MMH DATE 8-10-84  
CHECKED \_\_\_\_\_ DATE \_\_\_\_\_

## REPAIRS COMPLETED IN MAY

- 1) Road at base of dike
- 2) riprap at fly ash pipe discharge
- 3) riprap at spillway outfall
- 4) collar around spillway pipe
- 5) leaks in concrete pipe
- 6) Dike roadway improvement

\* ACTUAL COST = \$ 105,000

## ADDITIONAL REPAIRS TO BE MADE ON REVER BANK

### 3 ALTERNATIVES FOR CONTINUED WET PONDING \*

1) 15' Riprap to 1076	FS 1.11	\$188,000 estimate
2) 25' Riprap to 1080	FS 1.24	\$314,000 estimate
3) 20' Riprap to 1085 w/ 16' berm @ 1070	FS 1.50	\$509,000 estimate

\* Costs include mobilization & demob, 10% field expenses  
& 10% contingency (for future work)

ORIGINAL Order of Magnitude ESTIMATE (March 84) was \$350,000

JSP Pond J repairs - 1984  
COSTS - continued

COMPUTED MHM DATE 8-10-84  
CHECKED DATE

ADDITIONAL REPAIRS FOR DIKE AT DODSON CREEK

2 ALTERNATIVES FOR CONTINUED WET PONDING

environmental  
review  
required for  
stream modification

1) Riprap @ 1080 w/  
10' berm @ 1070 FS 1.17 \$144,000

2) 4:1 outside slope  
for dike FS 1.47 \$165,000

\* TOTAL COST FOR FS 1.5± = \$779,000

\* TOTAL COST FOR FS 1.2± = \$563,000

\* includes \$105,000 already spent by Const. — Does not include any engineering costs (most engineering is complete).

PROBLEM: THE REPAIR OF JOHN SEVIER ASH POND "J"

CALLED FOR BOTTOM ASH IN THE DESIGN. DURING CONSTRUCTION FLY ASH WAS DUMPED INSTEAD OF BOTTOM ASH.

DESCRIPTION: CHANGE IN DESIGN WAS NEEDED WHEN THE BOTTOM ASH SUPPLY WAS FOUND TO BE VERY LIMITED AND THERE WAS NOT ENOUGH BOTTOM ASH FOR THE DESIGN. TWO CHANGES TO THE DESIGN WERE PROPOSED. THE FIRST WAS TO REMOVE DUMPED FLY ASH AND REPLACE WITH COMPACTED FLY ASH. WITH A 3:1 SLOPE, THE FIRST PROPOSAL WAS FOUND TO HAVE A SAFETY FACTOR OF LESS THAN 1.2, THEREFORE WAS UNSATISFACTORY. THE SECOND PROPOSAL WAS TO REMOVE THE DUMPED FLY ASH PLACE A ROCK FILL BELOW THE WATER LEVEL AND THE TOP OF THE ROCK FILL BE PLACED SUCH THAT COMPACTED FLY ASH COULD BE PLACED ON TOP OF THE ROCK FILL. (SEE FIGURE 1)

## RECOMMENDATION:

USE INSIDE SLOPE WITH CLAY FILL @ 2:1 SLOPE,  
COMPACTED ASH FILL @ 2.5:1 SLOPE, AND ROCK FILL AT THE  
TOE OF THE SLOPE AS SHOWN IN FIGURE 1.

THE SLOPE WILL BE REANALYZED WITH THE  
LABORATORY TESTING RESULTS OF R TRIAXIAL SHEAR TESTS,  
WHEN THE RESULTS ARE AVAILABLE.
